

SIMATS ENGINEERING

ASSESSMENT TOOL 2

COURSE NAME: OBJECT ORIENTED ANALYSIS AND DESIGN
COURSE CODE: CSA1102

COURSE OUTCOME COVERED

CO4:

implement object-oriented system layers using design principles and patterns, and integrate access and view layers with OODBMS (*BL5*)

Assessment Tool Weightage: 40%

QUESTIONS: 5

Total Marks:40

Annexure A

Industry Problem Solving Task

Code of Conduct:

*I _____ (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment.
I understand that any violation of academic integrity rules will result in disciplinary action.*

Signature of the student:

Annexure A

Industry Problem Solving Task

1. Smart Banking and Financial Management System

A financial institution develops a **Smart Banking and Financial Management System** to manage customer accounts, fund transfers, loan processing, bill payments, and transaction history. The application follows a layered object-oriented architecture consisting of a presentation layer, service layer, domain layer, and data access layer connected to an OODBMS.

The system uses the **Factory Pattern** to create different account types, the **Strategy Pattern** for loan-interest and payment calculation policies, and the **Observer Pattern** for transaction and fraud alerts. A **Repository Pattern** is used to manage communication with persistent banking objects. The architecture is designed to support future services such as investment management and digital wallets.

Question:

Analyze how object-oriented principles, layered architecture, and design patterns contribute to the scalability, security, flexibility, and maintainability of the banking system. Explain how the application layers communicate with the OODBMS to store and retrieve persistent banking objects.

2. Smart Retail and Inventory Management System

A retail organization develops a **Smart Retail and Inventory Management System** to manage products, suppliers, customers, purchase orders, sales transactions, and warehouse stock. The system follows a layered object-oriented architecture with presentation, business, domain, and data access layers connected to an OODBMS.

The system applies the **MVC Pattern** for managing user interfaces, the **Factory Pattern** for creating different product categories, and the **Observer Pattern** to notify managers when inventory reaches a minimum threshold. The **DAO Pattern** handles communication with persistent inventory objects. The architecture allows future integration of automated stock prediction and robotic warehouse management.

Question:

Evaluate how object-oriented design principles, layered architecture, and design patterns improve the flexibility, scalability, and maintainability of the retail system. Explain how the different layers interact with the OODBMS for efficient inventory persistence and retrieval.

3. Smart Hotel and Hospitality Management System

A hotel chain develops a **Smart Hotel Management System** to manage guest registration, room reservations, check-in/check-out, payments, room services, and customer feedback. The application uses a layered object-oriented architecture consisting of presentation, service, domain, and data access layers connected to an OODBMS.

The system implements the **Strategy Pattern** for different pricing and discount policies, the **Factory Pattern** for creating room and service objects, and the **Observer Pattern** for reservation and service notifications. A **Repository Pattern** is used to simplify communication between business components and persistent hotel objects. Future enhancements include smart-room automation and personalized guest services.

Question:

Analyze how object-oriented principles and design patterns support flexibility, reusability, and maintainability in the hotel management system. Explain how the layered architecture coordinates reservation processing and communicates with the OODBMS for persistent data management.

4. Smart Logistics and Delivery Management System

A logistics company develops a **Smart Logistics and Delivery Management System** to manage shipment registration, warehouse operations, vehicle allocation, delivery tracking, and customer notifications. The system adopts a layered object-oriented architecture with presentation, business, domain, and data access layers connected to an OODBMS.

The system uses the **Strategy Pattern** for selecting optimal delivery routes, the **Factory Pattern** for creating different shipment types, and the **Observer Pattern** for real-time delivery status notifications. A **DAO Pattern** manages persistent shipment and vehicle information. The architecture is designed to support future integration with autonomous delivery vehicles and AI-based route optimization.

Question:

Examine how object-oriented design principles, layered architecture, and design patterns improve the adaptability, scalability, and maintainability of the logistics system. Explain how the layers communicate with the OODBMS to manage persistent shipment, vehicle, and delivery information.

5. Smart Energy Management System

An energy management company develops a **Smart Energy Management System** to monitor electricity consumption, manage smart meters, analyze energy usage, and generate alerts for abnormal consumption. The system follows a layered object-oriented architecture where the presentation layer provides dashboards, the business layer performs energy

analysis, the domain layer manages energy-related rules, and the data access layer communicates with an OODBMS.

The system uses the **Observer Pattern** for consumption alerts, the **Strategy Pattern** for different energy optimization algorithms, and the **Factory Pattern** for creating different smart-meter objects. A **Repository Pattern** is used to manage persistent energy data. The architecture is designed to accommodate future renewable-energy monitoring and AI-based consumption prediction.

Question:

Evaluate how object-oriented principles, layered architecture, and design patterns contribute to the scalability, extensibility, and maintainability of the energy management system. Explain the interaction between the system layers and the OODBMS for storing, retrieving, and managing persistent energy-monitoring objects.

RUBRICS FOR CALCULATION

Industry Problem Solving Task

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Understanding of Industry Problem	20%	Comprehensive understanding of real-world problem and constraints	Good understanding with minor gaps in requirements	Basic understanding; some requirements unclear	Poor understanding ; misinterprets problem context
Application of Engineering Concepts	25%	Applies advanced and relevant concepts effectively to solve the problem	Applies appropriate concepts with minor errors	Limited application of concepts	Incorrect or no application of concepts
Solution Design	25%	Innovative, practical, and feasible solution aligned with industry standards	Logical and feasible solution with minor gaps	Basic solution with limited feasibility	Unclear or impractical solution
Use of Tools	15%	Effective use of modern tools, technologies, and real data	Appropriate use of tools with correct implementation	Limited or inconsistent use of tools	Minimal or incorrect use of tools
Analysis	10%	Thorough analysis with validated results and performance evaluation	Good analysis with reasonable validation	Basic analysis with limited validation	Poor or no analysis
Professionalism	5%	Highly professional, well-documented, and clearly presented work	Good documentation and presentation	Basic documentation with some gaps	Poor documentation and presentation
